Crazy Justice is a third-person shooter game in cel-shaded style with steampunk elements.A programmable logic device (PLD) is a digital circuit programmed by a user to provide various logical functions. A typical PLD includes several lookup tables (LUTs) that are programmed to provide fixed, customized logic functions. Such LUTs, when implemented in hardware, can be quite large and can consume a significant amount of space on the device. The space that the LUTs take up is in addition to the space that is generally consumed by the PLD's input, output, and other components. For example, a typical PLD can comprise between a few to over a thousand LUTs, and each LUT can be programmed to perform a fixed function (or a function that is selected from a fixed set of predefined functions). In contrast to a typical PLD, a PLD with configurable LUTs (also

referred to as a programmable logic array (PLA)) provides the user with a much greater degree of flexibility. In PLAs, the LUTs are replaced by configurable memory elements, such as random access memory (RAM) cells, that can be configured to perform a wide variety of functions. PLAs typically comprise greater numbers of memory elements than PLDs; for example, a typical PLA contains between hundreds to thousands of memory elements. In addition, PLAs can typically have a much greater degree of functionality than PLDs. Although PLAs provide the advantages of greater flexibility and more functionality, PLAs and PLDs are nevertheless both generally “fixed function” devices, in the sense that they are programmed or configured to perform specific logic functions. Although some PLDs can be reprogrammed by the user, and

From the past, a transmission electron microscope (TEM) is generally used to investigate microstructural information of a sample. However, since the TEM has a big size of an apparatus and generates a lot of noise in an operation, it is not easy to operate the TEM, and it is also difficult to observe and analyze a sample in a short time. Thus, there has been proposed a method for observing a sample using a laser scanning microscope

which is called a LSM or LSCM (scanning TEM, hereinafter, abbreviated as STM). Here, the LSM is a microscope which is designed so that a laser beam can be deflected and reflected by a sample and thus, for example, a sample is irradiated with a focused laser beam, thereby ablating or melting the sample or generating a phase change in the sample.

Then,
